

systemPipeR: NGS workflow and report generation environment

Thomas Girke
Email contact: thomas.girke@ucr.edu

September 2, 2014

1 Introduction

systemPipeR provides utilities for building *end-to-end* analysis workflows with automated report generation for next generation sequence (NGS) applications such as RNA-Seq, ChIP-Seq, BS-Seq, VAR-Seq and many others ([Girke, 2014](#)). An important feature is support for running command-line software, such as NGS aligners, on both single machines or compute clusters. This includes both interactive job submissions or batch submissions to queuing systems of clusters (tested only with Torque). For instance, *systemPipeR* can be used with most command-line aligners such as BWA ([Li, 2013](#); [Li and Durbin, 2009](#)), TopHat 2 ([Kim et al., 2013](#)) and Bowtie 2 ([Langmead and Salzberg, 2012](#)), as well as the R-based NGS aligner *Rsubread* ([Liao et al., 2013](#)). Efficient handling of complex sample sets and experimental designs is facilitated by a well-defined sample annotation infrastructure which improves reproducibility and user-friendliness of many typical analysis workflows in the NGS area ([Lawrence et al., 2013](#)).

Templates for setting up custom project reports are provided as *.Rnw files in the vignettes subdirectory of this package. The corresponding PDFs of these report templates are linked here: [systemPipeRNAseq](#), [systemPipeChIPseq](#) and [systemPipeVARseq](#).

2 Getting Started

2.1 Installation

The R software for running *systemPipeR* can be downloaded from CRAN (<http://cran.at.r-project.org/>). The *systemPipeR* package can be installed from R using the *biocLite* install command.

```
> source("http://bioconductor.org/biocLite.R") # Sources the biocLite.R installation script
> biocLite("systemPipeR") # Installs the package
```

2.2 Loading the Package and Documentation

```
> library("systemPipeR") # Loads the package
> library(help="systemPipeR") # Lists all functions and classes
> vignette("systemPipeR") # Opens this PDF manual from R
```

2.3 Sample FASTQ Files

The mini sample FASTQ files used by this overview vignette as well as the associated workflow reporting vignettes can be downloaded from [here](#). The chosen data set [SRP010938](#) contains 18 paired-end (PE) read sets from *Arabidopsis thaliana* ([Howard et al., 2013](#)). To minimize processing time during testing, each FASTQ file has been subsetting to 90,000-100,000 randomly sampled PE reads that map to the first 100,000 nucleotides of each chromosome of the *A. thaliana* genome. The corresponding reference genome sequence (FASTA) and its GFF annotation files (provided in the same download) have been truncated accordingly. This way the entire test sample data set is less than 200MB in storage space. A PE read set has been chosen for this test data set for flexibility, because it can be used for testing both types of analysis routines requiring either SE (single end) reads or PE reads.

3 Structure of targets file

The targets file defines all FASTQ files and sample comparisons of an analysis workflow. The following shows the format of a sample targets file provided by this package.

```
> library(systemPipeR)
> targetspath <- system.file("extdata", "targets.txt", package="systemPipeR")
> read.delim(targetspath, comment.char = "#")
```

	FileName	SampleName	Factor	SampleLong	Experiment	Date
1	./data/SRR446027_1.fastq	M1A	M1	Mock.1h.A	1	23-Mar-2012
2	./data/SRR446028_1.fastq	M1B	M1	Mock.1h.B	1	23-Mar-2012

```

3  ./data/SRR446029_1.fastq      A1A      A1      Avr.1h.A      1 23-Mar-2012
4  ./data/SRR446030_1.fastq      A1B      A1      Avr.1h.B      1 23-Mar-2012
5  ./data/SRR446031_1.fastq      V1A      V1      Vir.1h.A      1 23-Mar-2012
6  ./data/SRR446032_1.fastq      V1B      V1      Vir.1h.B      1 23-Mar-2012
7  ./data/SRR446033_1.fastq      M6A      M6      Mock.6h.A      1 23-Mar-2012
8  ./data/SRR446034_1.fastq      M6B      M6      Mock.6h.B      1 23-Mar-2012
9  ./data/SRR446035_1.fastq      A6A      A6      Avr.6h.A      1 23-Mar-2012
10 ./data/SRR446036_1.fastq      A6B      A6      Avr.6h.B      1 23-Mar-2012
11 ./data/SRR446037_1.fastq      V6A      V6      Vir.6h.A      1 23-Mar-2012
12 ./data/SRR446038_1.fastq      V6B      V6      Vir.6h.B      1 23-Mar-2012
13 ./data/SRR446039_1.fastq      M12A     M12     Mock.12h.A     1 23-Mar-2012
14 ./data/SRR446040_1.fastq      M12B     M12     Mock.12h.B     1 23-Mar-2012
15 ./data/SRR446041_1.fastq      A12A     A12     Avr.12h.A      1 23-Mar-2012
16 ./data/SRR446042_1.fastq      A12B     A12     Avr.12h.B      1 23-Mar-2012
17 ./data/SRR446043_1.fastq      V12A     V12     Vir.12h.A      1 23-Mar-2012
18 ./data/SRR446044_1.fastq      V12B     V12     Vir.12h.B      1 23-Mar-2012

```

Structure of targets file for paired end (PE) samples.

```

> library(systemPipeR)
> targetspath <- system.file("extdata", "targets.txt", package="systemPipeR")
> read.delim(targetspath, comment.char = "#")[1:2,1:6]

```

	FileName	SampleName	Factor	SampleLong	Experiment	Date
1	./data/SRR446027_1.fastq	M1A	M1	Mock.1h.A	1	23-Mar-2012
2	./data/SRR446028_1.fastq	M1B	M1	Mock.1h.B	1	23-Mar-2012

Comparisons are defined in the header lines of the targets starting with '# <CMP>'. The function readComp imports the comparison and stores them in a list.

```

> readComp(file=targetspath, format="vector", delim="--")

$CMPset1
[1] "M1-A1" "M1-V1" "A1-V1" "M6-A6" "M6-V6" "A6-V6" "M12-A12" "M12-V12" "A12-V12"

$CMPset2
[1] "M1-A1" "M1-V1" "M1-M6" "M1-A6" "M1-V6" "M1-M12" "M1-A12" "M1-V12" "A1-V1"
[10] "A1-M6" "A1-A6" "A1-V6" "A1-M12" "A1-A12" "A1-V12" "V1-M6" "V1-A6" "V1-V6"
[19] "V1-M12" "V1-A12" "V1-V12" "M6-A6" "M6-V6" "M6-M12" "M6-A12" "M6-V12" "A6-V6"
[28] "A6-M12" "A6-A12" "A6-V12" "V6-M12" "V6-A12" "V6-V12" "M12-A12" "M12-V12" "A12-V12"

```

4 Structure of param file and SYSargs container

The param file defines the parameters of the command-line software. The following shows the format of a sample param file provided by this package.

```

> parampath <- system.file("extdata", "tophat.param", package="systemPipeR")
> read.delim(parampath, comment.char = "#")

```

	PairSet	Name	Value
1	modules	<NA>	bowtie2/2.1.0
2	modules	<NA>	tophat/2.0.8b
3	software	<NA>	tophat
4	cores	-p	4
5	other	<NA>	-g 1 --segment-length 25 -i 30 -I 3000
6	outfile1	-o	<FileName1>

```

7  outfile1      path                ./results/
8  outfile1      remove              <NA>
9  outfile1      append              .tophat
10 outfile1 outextension             .tophat/accepted_hits.bam
11 reference     <NA>                ./data/tair10.fasta
12 infile1      <NA>                <FileName1>
13 infile1      path                 <NA>
14 infile2      <NA>                <FileName2>
15 infile2      path                 <NA>

```

The `systemArgs` function imports the definitions of both the param file and the targets file, and stores all relevant information as `SYSargs` object.

```

> args <- systemArgs(sysma=parampath, mytargets=targetspath)
> args

```

An instance of 'SYSargs' for running 'tophat' on 18 samples

Several accessor functions are available that are named after the slot names of the `SYSargs` object class.

```

> names(args)

[1] "modules"  "software" "cores"    "other"    "reference" "results"  "infile1"
[8] "infile2"  "outfile1" "sysargs"  "outpaths"

> modules(args)

[1] "bowtie2/2.1.0" "tophat/2.0.8b"

> cores(args)

[1] 4

> outpaths(args)[1]

```

```
"/Users/tgirke/GoogleDrive/Projects/github/systemPipeR/vignettes/results/SRR446027_1.fastq.tophat/accepted."

```

```
> sysargs(args)[1]

```

```
"tophat -p 4 -g 1 --segment-length 25 -i 30 -I 3000 -o /Users/tgirke/GoogleDrive/Projects/github/systemPipeR/vignettes/results/SRR446027_1.fastq.tophat/accepted."

```

The content of the param file can be returned as JSON object as follows (requires *rjson* package).

```

> systemArgs(sysma=parampath, mytargets=targetspath, type="json")

[1] "{\"modules\":{\"n1\":\"\",\"v2\":\"bowtie2/2.1.0\",\"n1\":\"\",\"v2\":\"tophat/2.0.8b\"},\"software\"

```

5 Workflow

5.1 Define environment settings and samples

Load package:

```
> library(systemPipeR)
```

Construct `SYSargs` object from param and targets files.

```
> args <- systemArgs(sysma="tophat.param", mytargets="targetsPE.txt")
```

5.2 FASTQ quality report

The following `seeFastq` and `seeFastqPlot` functions generate and plot a series of useful quality statistics for a set of FASTQ files including per cycle quality box plots, base proportions, base-level quality trends, relative k-mer diversity, length and occurrence distribution of reads, number of reads above quality cutoffs and mean quality distribution.

```
> fqlist <- seeFastq(fastq=infile1(args), batchsize=10000, klength=8)
> pdf("./results/fastqReport.pdf", height=18, width=4*length(fqlist))
> seeFastqPlot(fqlist)
> dev.off()
```

Figure 1: QC report for 18 FASTQ files.

5.3 Alignment with Tophat 2

Build Bowtie 2 index.

```
> moduleload(modules(args)) # Skip if module system is not available
> system("bowtie2-build ./data/tair10.fasta ./data/tair10.fasta")
```

Execute SYSargs on a single machine without submitting to a queuing system of a compute cluster. This way the input FASTQ files will be processed sequentially. If available, multiple CPU cores can be used for processing each file. The number of CPU cores (here 4) to use for each process is defined in the `*.param` file. With `cores(args)` one can return this value from the SYSargs object. Note, if a module system is not installed or used, then the argument setting `usemodule=FALSE` should be included in `runCommandline`.

```
> bampaths <- runCommandline(args=args)
```

Alternatively, the computation can be greatly accelerated by processing many files in parallel using several compute nodes of a cluster, where a scheduling/queuing system is used for load balancing. To avoid over-subscription of CPU cores on the compute nodes, the value from `cores(args)` is passed on to the submission command, here `cores` under `getQsubargs`. The number of independent parallel qsub processes is defined under the `Nqsubs` argument. The following example will run 18 processes in parallel using for each 4 CPU cores. If the resources available on a cluster allow to run all 18 processes at the same time then the shown sample submission will utilize in total 72 CPU cores.

```
> qsubargs <- getQsubargs(queue="batch", cores=cores(args), memory="mem=10gb", time="walltime=20:00:00")
> (joblist <- qsubRun(args=args, qsubargs=qsubargs, Nqsubs=18, package="systemPipeR"))
```

Alignment Stats

```
> read_statsDF <- alignStats(args)
> write.table(read_statsDF, "results/alignStats.xls", row.names=FALSE, quote=FALSE, sep="\t")
```

5.4 Create symbolic links for viewing BAM files in IGV

The genome browser IGV supports reading indexed/sorted BAM via web URLs. This way no unnecessary copies of these large files need to be generated. To enable this approach, an HTML directory with http access needs to be available in the user account (e.g. /public_html) of a system. If this is not the case then the BAM files need to be moved or copied to the system where IGV runs. In the following, `htmlDir` defines the path to the HTML directory with http access where the symbolic links to the BAM files will be stored. The corresponding URLs will be written to a text file specified under the `urlfile` argument.

```
> symLink2bam(sysargs=args, htmlDir=c("~/html/", "somedir/"),
+           urlbase="http://myserver.edu/~username/",
+           urlfile="IGVurl.txt")
```

5.5 Alignment with Bowtie 2 (here for miRNA profiling experiment)

Run as single process without submitting to cluster, e.g. via `qsub -l`.

```
> args <- systemArgs(sysma="bowtieSE.param", mytargets="targets.txt")
> bamPaths <- runCommandline(args=args)
```

Alternatively, submit the job to compute nodes.

```
> qsubargs <- getQsubargs(queue="batch", cores=cores(args), memory="mem=10gb", time="walltime=20:00:00")
> (joblist <- qsubRun(args=args, qsubargs=qsubargs, Nqsubs=18, package="systemPipeR"))
```

5.6 Read counting for mRNA profiling experiments

Create `txdb` (needs to be done only once)

```
> library(GenomicFeatures)
> txdb <- makeTranscriptDbFromGFF(file="data/tair10.gff", format="gff", dataSource="TAIR", species="A. thaliana")
> saveDb(txdb, file="./data/tair10.sqlite")
```

Read counting with `summarizeOverlaps` in parallel mode with multiple cores

```
> library(BiocParallel)
> txdb <- loadDb("./data/tair10.sqlite")
> eByg <- exonsBy(txdb, by="gene")
> bfl <- BamFileList(outPaths(args), yieldSize=50000, index=character())
> multicoreParam <- MulticoreParam(workers=4); register(multicoreParam); registered()
> counteByg <- bplapply(bfl, function(x) summarizeOverlaps(eByg, x, mode="Union", ignore.strand=TRUE, intersect="any"))
> countDFeByg <- sapply(seq(along=counteByg), function(x) assays(counteByg[[x]])$counts)
> rownames(countDFeByg) <- names(rowData(counteByg[[1]])); colnames(countDFeByg) <- names(bfl)
> rpkmDFeByg <- apply(countDFeByg, 2, function(x) returnRPKM(counts=x, ranges=eByg))
> write.table(countDFeByg, "results/countDFeByg.xls", col.names=NA, quote=FALSE, sep="\t")
> write.table(rpkmDFeByg, "results/rpkmDFeByg.xls", col.names=NA, quote=FALSE, sep="\t")
```

5.7 Read counting for miRNA profiling experiments

Download miRNA genes from miRBase

```
> system("wget ftp://mirbase.org/pub/mirbase/19/genomes/My_species.gff3 -P ./data/")
> gff <- import.gff("./data/My_species.gff3", asRangedData=FALSE)
> gff <- split(gff, elementMetadata(gff)$ID)
> bams <- names(bamPaths); names(bams) <- targets$SampleName
```

```

> bfl <- BamFileList(bams, yieldSize=50000, index=character())
> countDFmiR <- summarizeOverlaps(gff, bfl, mode="Union", ignore.strand=FALSE, inter.feature=FALSE) # Note
> rpkmDFmiR <- apply(countDFmiR, 2, function(x) returnRPKM(counts=x, gffsub=gff))
> write.table(assays(countDFmiR)$counts, "results/countDFmiR.xls", col.names=NA, quote=FALSE, sep="\t")
> write.table(rpkmDFmiR, "results/rpkmDFmiR.xls", col.names=NA, quote=FALSE, sep="\t")

```

5.8 Correlation analysis of samples

The following computes the sample-wise Spearman correlation coefficients from the RPKM normalized expression values. After transformation to a distance matrix, hierarchical clustering is performed with the `hclust` function and the result is plotted as a dendrogram ([sample_tree.pdf](#)).

```

> library(ape)
> rpkmDfFeByg <- read.table("./results/rpkmDfFeByg.xls", check.names=FALSE)
> rpkmDfFeByg <- rpkmDfFeByg[rowMeans(rpkmDfFeByg) > 50,]
> d <- cor(rpkmDfFeByg, method="spearman")
> hc <- hclust(as.dist(1-d))
> plot.phylo(as.phylo(hc), type="p", edge.col="blue", edge.width=2, show.node.label=TRUE, no.margin=TRUE)

```

Figure 2: Correlation dendrogram of samples.

5.9 DEG analysis with edgeR

```

> targets <- read.delim(targetspath, comment="#")
> cmp <- readComp(file=targetspath, format="matrix", delim="-")
> cmp[[1]]

```

	[,1]	[,2]
[1,]	"M1"	"A1"
[2,]	"M1"	"V1"
[3,]	"A1"	"V1"
[4,]	"M6"	"A6"
[5,]	"M6"	"V6"
[6,]	"A6"	"V6"
[7,]	"M12"	"A12"
[8,]	"M12"	"V12"
[9,]	"A12"	"V12"

Run *edgeR*

```
> countDFeByg <- read.delim("./results/countDFeByg.xls", row.names=1)
> edgeDF <- run_edgeR(countDF=countDFeByg, targets=targets, cmp=cmp[[1]], independent=FALSE, mdsplot="")
```

Filter and plot DEG results for up and down regulated genes. Because of the small size of the toy data set used by this vignette, the FDR value has been set to a relatively high threshold (here 10%). More commonly used FDR cutoffs are 1% or 5%.

```
> DEG_list <- filterDEGs(degDF=edgeDF, filter=c(Fold=2, FDR=10))
```

Figure 3: Up and down regulated DEGs.

```
> names(DEG_list)
> DEG_list$Summary
```

5.10 GO term enrichment analysis of DEGs

5.10.1 Obtain gene-to-GO mappings

The following shows how to obtain gene-to-GO mappings from *biomaRt* (here for *A. thaliana*) and how to organize them for the downstream GO term enrichment analysis. Alternatively, the gene-to-GO mappings can be obtained for many organisms from Bioconductor's *.db genome annotation packages or GO annotation files provided by various genome databases. For each annotation this relatively slow preprocessing step needs to be performed only once. Subsequently, the preprocessed data can be loaded with the *load* function as shown in the next subsection.

```
> library("biomaRt")
> listMarts() # To choose BioMart database
> m <- useMart("ENSEMBL_MART_PLANT"); listDatasets(m)
> m <- useMart("ENSEMBL_MART_PLANT", dataset="athaliana_eg_gene")
```

```

> listAttributes(m) # Choose data types you want to download
> go <- getBM(attributes=c("go_accession", "tair_locus", "go_namespace_1003"), mart=m)
> go <- go[go[,3]!="",]; go[,3] <- as.character(go[,3])
> dir.create("./data/GO")
> write.table(go, "data/GO/GOannotationsBiomart_mod.txt", quote=FALSE, row.names=FALSE, col.names=FALSE, sep=" ")
> catdb <- makeCATdb(myfile="data/GO/GOannotationsBiomart_mod.txt", lib=NULL, org="", colno=c(1,2,3), idcol="go_accession")
> save(catdb, file="data/GO/catdb.RData")

```

5.10.2 Batch GO term enrichment analysis

Apply the enrichment analysis to the DEG sets obtained in the above differential expression analysis. Note, in the following example the FDR filter is set here to an unreasonably high value, simply because of the small size of the toy data set used in this vignette. Batch enrichment analysis of many gene sets is performed with the `GOCluster_Report` function. When `method="all"`, it returns all GO terms passing the p-value cutoff specified under the `cutoff` arguments. When `method="slim"`, it returns only the GO terms specified under the `myslimv` argument. The given example shows how one can obtain such a GO slim vector from BioMart for a specific organism.

```

> load("data/GO/catdb.RData")
> DEG_list <- filterDEGs(degDF=edgeDF, filter=c(Fold=2, FDR=50), plot=FALSE)
> up_down <- DEG_list$UpOrDown; names(up_down) <- paste(names(up_down), "_up_down", sep=" ")
> up <- DEG_list$Up; names(up) <- paste(names(up), "_up", sep=" ")
> down <- DEG_list$Down; names(down) <- paste(names(down), "_down", sep=" ")
> DEGlist <- c(up_down, up, down)
> DEGlist <- DEGlist[sapply(DEGlist, length) > 0]
> BatchResult <- GOCluster_Report(catdb=catdb, setlist=DEGlist, method="all", id_type="gene", CLSZ=2, cutoff=0.05)
> library("biomaRt"); m <- useMart("ENSEMBL_MART_PLANT", dataset="athaliana_eg_gene")
> goslimvec <- as.character(getBM(attributes=c("goslim_goa_accession"), mart=m)[,1])
> BatchResultslim <- GOCluster_Report(catdb=catdb, setlist=DEGlist, method="slim", id_type="gene", myslimv=goslimvec)

```

5.10.3 Plot batch GO term results

The data.frame generated by `GOCluster_Report` can be plotted with the `goBarplot` function. Because of the variable size of the sample sets, it may not always be desirable to show the results from different DEG sets in the same bar plot. Plotting single sample sets is achieved by subsetting the input data frame as shown in the first line of the following example.

```

> gos <- BatchResultslim[grep("M6-V6_up_down", BatchResultslim$CLID), ]
> gos <- BatchResultslim
> pdf("GOslimbarplotMF.pdf", height=8, width=10); goBarplot(gos, gocat="MF"); dev.off()
> goBarplot(gos, gocat="BP")
> goBarplot(gos, gocat="CC")

```

Figure 4: GO Slim Barplot for MF Ontology.

5.11 Clustering and heat maps

The following example performs hierarchical clustering on the RPKM normalized expression matrix subsetting by the DEGs identified in the above differential expression analysis. It uses a Pearson correlation-based distance measure and complete linkage for cluster joining.

```
> library(pheatmap)
> geneids <- unique(as.character(unlist(DEG_list[[1]])))
> y <- rpkmDFeByg[geneids, ]
> pdf("heatmap1.pdf")
> pheatmap(y, scale="row", clustering_distance_rows="correlation", clustering_distance_cols="correlation")
> dev.off()
```

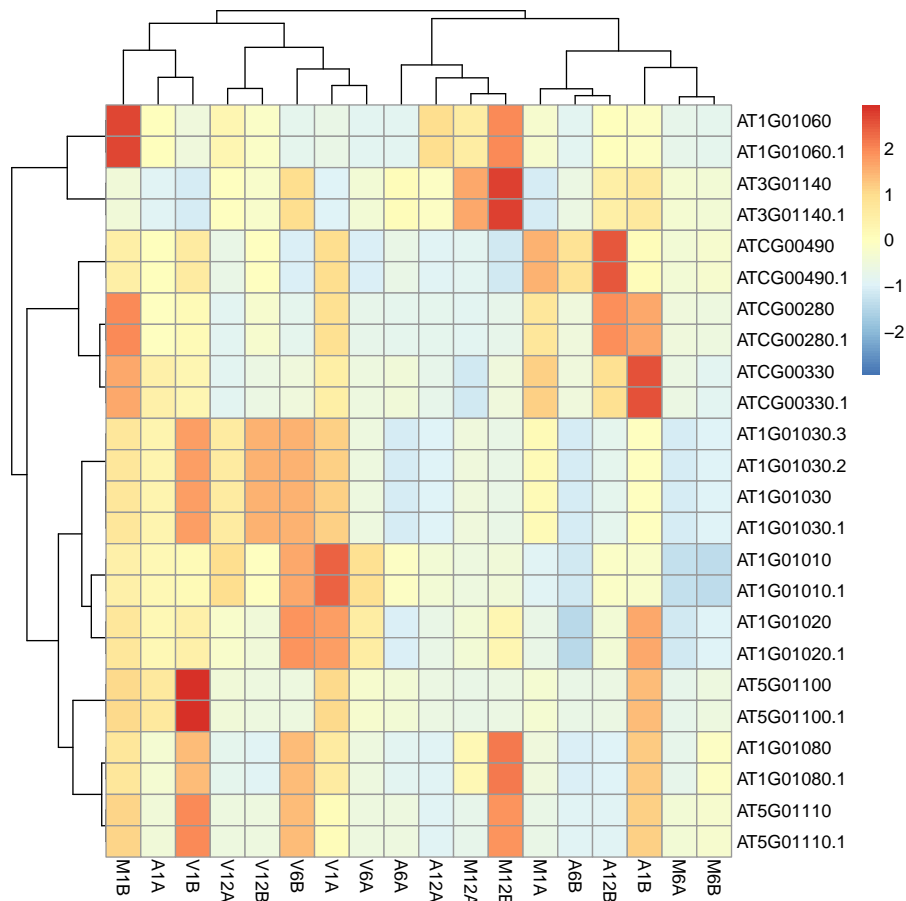

Figure 5: Heat map with hierarchical clustering dendrograms of DEGs.

6 Version Information
