systemPipeR: pipeline to run command-line NGS software

Thomas Girke Email contact: thomas.girke@ucr.edu

May 18, 2014

1 Introduction

systemPipeR is a pipeline for running command-line software, such as NGS aligners, on both single machines or compute clusters. It supports interactive job submissions or batch submissions to queuing systems of clusters (tested only with Torque). Currently, the following command-line aligners are supported: TopHat 2 (Kim et al., 2013) and Bowtie 2 (Langmead and Salzberg, 2012).

2 **Getting Started**

2.1 Installation

The R software can be downloaded from CRAN (http://cran.at.r-project.org/) and the *systemPipeR* package from GitHub (https://github.com/tgirke/systemPipeR). The *systemPipeR* package can be installed from R using the install.packages command after downloading and uncompressing the package directory.

- > # \$ R CMD build systemPipeR # Builds package
- > install.packages("systemPipeR.1.0.0.tar.gz", repos=NULL, type="source") # Installs the package

systemPipeR Manual 4 Workflow

2.2 Loading the Package and Documentation

```
> library("systemPipeR") # Loads the package
```

- > library(help="systemPipeR") # Lists all functions and classes
- > vignette("systemPipeR") # Opens this PDF manual from R

3 Structure of targets file

> library(systemPipeR)

7 /my/path/TGA.fq.gz

8 /my/path/ACA.fq.gz

The targets file defines all samples and comparisons of the analysis workflow. The following shows the format of a sample targets file provided by this package.

```
> targetspath <- pasteO(system.file("extdata", package="systemPipeR"), "/targets.txt")
> read.delim(targetspath, comment.char = "#")
            FileName SampleName Factor SampleLong Experiment
                                                                   Date
                                                            1 11-Oct-13
1 /my/path/CGA.fq.gz
                             C1
                                     С
                                            Ctrl1
2 /my/path/TTA.fq.gz
                             C2
                                     C
                                            Ctrl1
                                                            1 11-Oct-13
                                     В
3 /my/path/ACT.fq.gz
                             B1
                                           Treat1
                                                           1 11-Oct-13
4 /my/path/GCC.fq.gz
                                                           1 03-Mar-14
                             B2
                                           Treat1
5 /my/path/CGA.fq.gz
                             D1
                                     D
                                           Treat2
                                                           1 03-Mar-14
6 /my/path/TTA.fq.gz
                                     D
                                                           1 03-Mar-14
                             D2
                                           Treat2
```

Comparisons are defined in the header lines of the targets starting with '# <CMP>'. The function readComp imports the comparison and stores them in a list.

1 03-Mar-14

1 03-Mar-14

Treat3

Treat3

```
> readComp(file=targetspath, format="vector", delim="-")
$CMPset1
[1] "C-B" "C-D" "C-E"
$CMPset2
```

E1

E2

Ε

Ε

4 Workflow

[1] "B-D" "D-E"

4.1 Define environment settings and samples

Load packages and functions

```
> library(systemPipeR)
```

```
> library(BSgenome); library(Rsamtools); library(rtracklayer); library(GenomicFeatures); library(Gviz); li
```

Generate input targets file. Note: for 'qsubRun()' the file targets_run.txt needs to contain absolute paths to FASTQ files in the "FileName" column.

```
> targets <- read.delim("targets.txt", comment.char = "#")
> write.table(targets, "targets_run.txt", row.names=FALSE, quote=FALSE, sep="\t")
```

4.2 Alignment with Tophat 2

Build Bowtie 2 index.

```
> system("bowtie2-build ./data/mygenome.fa ./data/bowtie2index/mygenome")
```

systemPipeR Manual 4 Workflow

```
Run as single process without submitting to cluster, e.g. via qsub -I.
> mymodules <- c("bowtie2/2.1.0", "tophat/2.0.8b")</pre>
> myargs <- c(software="tophat", p="-p 4", g="-g 1", segment_length="--segment-length 25", i="-i 30", I="-
> myref <- "./data/My_genome.fasta"</pre>
> tophatargs <- systemArgs(app="tophat2", mymodules=mymodules, mydir=getwd(), myargs=myargs, myref=myref, n
> bampaths <- runTophat(tophatargs=tophatargs, runid="01")</pre>
Submit to compute nodes.
> qsubargs <- getQsubargs(queue="batch", Nnodes="nodes=4", cores=as.numeric(gsub("^.* ", "", tophatargs$arg
> (joblist <- qsubRun(appfct="runTophat(appargs, runid)", appargs=tophatargs, qsubargs=qsubargs, Nqsubs=6,
Alignment Stats
> read_statsDF <- alignStats(fqpaths=tophatargs$infile1, bampaths=bampaths, fqgz=TRUE)
> read_statsDF <- cbind(read_statsDF[targets$FileName,], targets)</pre>
> write.table(read_statsDF, "results/alignStats.xls", row.names=FALSE, quote=FALSE, sep="\t")
      Alignement with Bowtie 2 (here for miRNA profiling experiment)
Run as single process without submitting to cluster, e.g. via qsub -I
> mymodules <- c("bowtie2/2.1.0")
> myargs <- c(software="bowtie2", p="-p 4", k="-k 50", other="--non-deterministic")
> myref <- "./data/My_genome.fasta"</pre>
> bowtieargs <- systemArgs(app="bowtie2", mymodules=mymodules, mydir=getwd(), myargs=myargs, myref=myref, n
> bampaths <- runBowtie(bowtieargs=bowtieargs, runid="01")</pre>
Submit to compute nodes
> qsubargs <- getQsubargs(queue="batch", Nnodes="nodes=4", cores=as.numeric(gsub("^.* ", "", bowtieargs$arg
> (joblist <- qsubRun(appfct="runBowtie(appargs, runid)", appargs=tophatargs, qsubargs=qsubargs, Nqsubs=6,
4.4 Read counting for mRNA profiling experiments
Create txdb (do only once)
> txdb <- makeTranscriptDbFromGFF(file="data/mygenome.gtf", format="gtf", dataSource="ENSEMBL", species="Mgenome.gtf",
> saveDb(txdb, file="./data/My_species.sqlite")
Read counting with summarizeOverlaps in parallel mode with multiple cores
> library(BiocParallel)
> txdb <- loadDb("./data/My_species.sqlite")</pre>
> eByg <- exonsBy(txdb, by="gene")</pre>
> bams <- names(bampaths); names(bams) <- targets$SampleName</pre>
> bfl <- BamFileList(bams, yieldSize=50000, index=character())</pre>
> multicoreParam <- MulticoreParam(workers=4); register(multicoreParam); registered()</pre>
> counteByg <- bplapply(bfl, function(x) summarizeOverlaps(gff, x, mode="Union", ignore.strand=TRUE, inter
> countDFeByg <- sapply(seq(along=counteByg), function(x) assays(counteByg[[x]])$counts)</pre>
> rownames(countDFeByg) <- names(rowData(counteByg[[1]])); colnames(countDFeByg) <- names(bfl)</pre>
> rpkmDFeByg <- apply(countDFeByg, 2, function(x) returnRPKM(counts=x, gffsub=eByg))</pre>
> write.table(assays(countDFeByg)$counts, "results/countDFeByg.xls", col.names=NA, quote=FALSE, sep="\t")
```

> write.table(rpkmDFeByg, "results/rpkmDFeByg.xls", col.names=NA, quote=FALSE, sep="\t")

systemPipeR Manual 7 References

4.5 Read counting for miRNA profiling experiments

Download miRNA genes from miRBase

```
> system("wget ftp://mirbase.org/pub/mirbase/19/genomes/My_species.gff3 -P ./data/")
> gff <- import.gff("./data/My_species.gff3", asRangedData=FALSE)
> gff <- split(gff, elementMetadata(gff)$ID)
> bams <- names(bampaths); names(bams) <- targets$SampleName
> bf1 <- BamFileList(bams, yieldSize=50000, index=character())
> countDFmiR <- summarizeOverlaps(gff, bf1, mode="Union", ignore.strand=FALSE, inter.feature=FALSE) # Note
> rpkmDFmiR <- apply(countDFmiR, 2, function(x) returnRPKM(counts=x, gffsub=gff))
> write.table(assays(countDFmiR)$counts, "results/countDFmiR.xls", col.names=NA, quote=FALSE, sep="\t")
> write.table(rpkmDFmiR, "results/rpkmDFmiR.xls", col.names=NA, quote=FALSE, sep="\t")
```

4.6 Correlation analysis of samples

```
> library(ape)
> rpkmDFeByg <- read.table("./results/rpkmDFeByg.xls", check.names=FALSE)
> rpkmDFeByg <- rpkmDFeByg[rowMeans(rpkmDFeByg) > 50,]
> d <- cor(rpkmDFeByg, method="spearman")
> hc <- hclust(as.dist(1-d))
> plot.phylo(as.phylo(hc), type="p", edge.col="blue", edge.width=2, show.node.label=TRUE, no.margin=TRUE)
```

4.7 Differential analysis

```
> cmp <- readComp(myfile="targets.txt", format="vector", delim="-")</pre>
```

5 Version Information

> toLatex(sessionInfo())

- R version 3.0.2 (2013-09-25), x86_64-unknown-linux-gnu
- Locale: 0
- Base packages: base, datasets, grDevices, graphics, methods, parallel, stats, utils
- Other packages: BiocGenerics 0.8.0, Biostrings 2.30.1, GenomicRanges 1.14.2, IRanges 1.20.1, Rsamtools 1.14.2, ShortRead 1.20.0, XVector 0.2.0, lattice 0.20-24, systemPipeR 1.0.0
- Loaded via a namespace (and not attached): Biobase 2.22.0, BiocStyle 1.0.0, RColorBrewer 1.0-5, bitops 1.0-6, grid 3.0.2, hwriter 1.3, latticeExtra 0.6-26, stats4 3.0.2, tools 3.0.2, zlibbioc 1.8.0

6 Funding

This software was developed with funding from the National Science Foundation: MCB-1021969.
